
Tagbot Plugin FAQ

Posted by admin - 2008/07/05 23:58

Where can I get the Tagbot Plugin for Joomla?

Visit the Tagbot Plugin Project Page. Instructions on where to download are there.

How do I add an unsupported Bookmarking site to the list of supported sites?

Each bookmarking site has a corresponding XML information file in the /mambots/content/tagbot/tagsites/ folder. You can use an existing XML file as a template, and create your own for a particular boomkarking site.

Is Tagbot xHTML Compliant?

Yes, it is fully xHTML1.0 compliant. You will however need to turn off your Joomla Global Content cache in the Global Configuration. I've managed to find work around for this cache problem that will work 99% of the time, and it will be implemented in the next release of Joomla Tagbot Plugin.

Hi Admin,

Would you please help me to add Facebook botton?

thanks,

Avi

<http://derberliten.de/>

Here is an example URL for adding <http://www.fijiwebdesign.com/> to facebook.

<http://www.new.facebook.com/share.php?u=http://www.fijiwebdesign.com/>

So the URL in the tagbot XML file would look something like:

<http://www.new.facebook.com/share.php?u={url}>

{url} would be replaced with the URL of the article being viewed in Joomla.

So the Tagbot XML file will look something like:

Facebook

{img_dir}/buttons/facebook_it.gif

{img_dir}/icons/facebook.16px.gif

<http://www.new.facebook.com/share.php?u={url}>

This assumes you have created a button and icon for facebook and saved them in the buttons/ and icons/ folders in the tagbot plugin directory.

The button would be named: facebook_it.gif

And the icon: facebook.16px.gif

=====

Hi Admin,
thanks for your post.
I just did all of this but got this as I try to open an article:
Fatal error: Cannot break/continue 1 level in /home/avush96/public_html/mambots/content/tagbot.php on line 449

any idea what to do?
thanks,
Avi

Hello Admin!
I had made it!!
All works just fine!
just one thing- you have to add the right lines also on the Tagbot xml file under content!
In a few places under the file list- for buttons and for icons and for xml file.
(just to follow the other files as an example!)

this was the missing part of your last post to me.
you can see it live now here: <http://derberliten.de>
have a nice day,

Avi
p.s SUPPER PLUGIN!
just added the icon and button for facebook <http://www.fijiwebdesign.com/images/fbfiles/images/facebook.gif> just change
the name of it for buttons and icons
