## I am confused

Posted by bas1985 - 2010/02/04 01:03

---

I made a php script to retrieve some data from a rss feed which seems to work fine outside Joomla

I tried this module.

copy/paste the code into the module, change a few paths to include etc.

But when I turn evaluate PHP on my entire Joomla just shows a blank white screen.

if I turn evaluate off the site is displayed

but inside the PHP module it starts echoing raw code as soon as it finds the first ">" character in the code

```
$output="";
$output.="";
$output.="";
$i=0;
$end=0;
```

and this is what is displayed:

```
'; $output.=""; $output.=""; $i=0; $end=0; while ($i < count($data) and $end !=1) { $output.=""; $output.=""; $output.="";
$output.=""; $i++; if ($i >= $maxResults) { $end = 1; } } $output.='
.substr($data, 5, 5).'.'.$data.'
'; $output = str_replace('obtained', '
```

and after that it does on printing the rest of the PHP code

Any clue ?

You need evaluate PHP turned to on.

Did you wrap your code in PHP tags?

Make sure you have error reporting on so you can see the errors generated.

```
error_reporting(E_ALL);
ini_set('display_errors', 1);
```

aaahhh ofcourse I am an idiot haha

I had turned on error reporting in my mind after just double checking it in fact wasn't. the error was due to a misspelled include somewhere

I did include the code in
