
Feature Request

Posted by shoulders - 2009/06/12 10:10

- option to remove blank line(s) at beginning and end of code. the reason for this is so when i am typing code in i can keep it neat but not have the first line empty when it is displayed in the article. this is probably a plugin option, dont know if a parameter is required.
- install all the latest languages in the next release
- option just to strip the geshibot tags only, this should allow me to use geshibot to insert code without need another plugin. ie `geshibot tag="nostrip"`
- ability to change the tag used (not important, might be useful)
- ability to set size of area the code is displayed in, with scroll bars
- an easy way of causing the code to wrap
- better instructions, ie updating language file, what languages are supported, what the parameters for geshibot are. I can help by writing these with the write info.
- update JED to say J1.5 is supported
- allow me to specify which component/menu item the plugin is used for. I currently am only using this for my wiki and turning it of for the rest of the site would reduce overheads

thanks

shoulders
