## Firebug says internal server error 500

Posted by MoneyMagnets - 2009/06/13 02:41

---

Hi,

I can't use most of the functionality with php speedy because my template vanishes but it has speeded up my site.

However in firebug under NET I get the following error....

http://www.money-magnets.net/plugins/system/php\_speedy/cache/js/\_cmp\_javascript\_c6a5742c6d80d14a5a4159a92696efd3.php

500 internal server error

So what does this mean (I know it's a server side error but what else) and how do I fix it?

http://www.money-magnets.net  
joomla 1.5.11 - legacy mode enabled  
Global Gzip off  
php speedy Gzip on (all other parameters off)

Let me know if you need any further info.

Thanks,  
Karen

PHP Speedy has some severe problems at the moment. I recommend not to use it on a production site at all.

I'm working on a full rewrite that does not require the PHP Speedy library, but uses the same optimizations.

when web server encounters an unexpected condition it prevents it to perform services needed by client. This results in 500 internal server error.

Server is not specific where problem has encountered.

This can be resolved by fixes to the Web server software. Its actually server side problem.

Then you noticed the lake justugg outlet a few paces behind you and several handkerchiefs and old socks that you have packed for your camping trip. You began taking off your UGG Australia boots and started wiping the exterior using a brisk but soft motion to free your boots off excess dirt. You then began soaking one of your handkerchiefs with lake water and began wiping them over your dirt covered UGG boots. You are surprised to see that some of the dirt is removed already. To dry your UGG boots. DCY
